File Handling

```
x = 10
print(x) => 10
```

→ session closed

↳ RAM

↳ A place where we store data permanently so that we can use it later.

sample.txt

```
file = open("sample.txt", 'r')
```

open the file → mode (permission)

↳ file name

→ r → only see

w → write (erase old)

a → add more

OOPS

↳ object oriented programming

```
customer_name = "____"
"  _age = ____
"  _balance = ____
```

→ scattered data

↓

Class → Design/blueprint.

```
class customer:
    pass
```

Object → real thing for class

```
c1 = customer()
c2
```

object → function call happens

```
b1 → 1000
b2 → 5000
```

self → object

```
class Bank:
    def __init__(self, balance):
        self.balance = balance

b1 = Bank(1000)
b2 = Bank(5000)

Bank.__init__(b1, 1000)
Bank.__init__(b2, 5000)
```

Call	self becomes	balance.
b1	b2	1000
b2	b2	5000
